## Search Notes

Dawn -

Here are the results to your search request. Note that "CY" represents any cyclic group, open to any substitution, in the search query. I could not address the variables following the graphic structure of Claim 1 b), as this statement represent too many permutations, and the structure would not run to completion.

I left "X" as either a carbon chain or a ring, again, open.

There are 15 bibliographic citations, and 24 hit structures, which beat applicants' filing date.

The structure query is saved for 10 business days. Please contact me if you need more.

Jan

\*Need search results by 3/26 if possible.

Access DB# 218413

## SEARCH REQUEST FORM

### Scientific and Technical Information Center

Requester's Full Name: DAWN GARRETT Examiner #: 76107 Date: 3/16/2007  
Art Unit: 1774 Phone Number: 2-1523 Serial Number: 10/786,372  
Mail Box and Bldg/Room Location: REM 70C 79 Results Format Preferred (circle): PAPER DISK E-MAIL

If more than one search is submitted, please prioritize searches in order of need.  
\*\*\*\*\*

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: \_\_\_\_\_ ( See Bib. data sheet )  
Inventors (please provide full names): \_\_\_\_\_

Earliest Priority Filing Date: \_\_\_\_\_

\*For Sequence Searches Only\* Please include all pertinent information (parent, child, divisional, or issued patent numbers along with Office appropriate serial number).

MAR 16 REC'D

Pat. & T.M. Office

Please search the polymer of claim 1.

I already have searches wherein each

Ar is phenyl and wherein the Ar groups form  
Carbazole groups (as in claim 2).

Please search the remaining possibilities for the  
polymer.

Thank you.

PRAI US 2004-786372		20040225 <-		

AB Electroluminescent devices comprising a spaced-apart anode and cathode and an organic layer disposed between the anode and the cathode are described in which the organic layer includes a polymer having arylamine repeating unit moieties described by the general formula -Ar(B)-X- (B = -N(Ar3)-Ar4-N(Ar2)-Ar1; Ar and Ar1-4 = independently selected C6-60 aryl groups and/or C4-60 heteroaryl groups, or Ar1 and Ar2, Ar3 and Ar4, Ar1 and Ar4, Ar2 and Ar4

*current application*

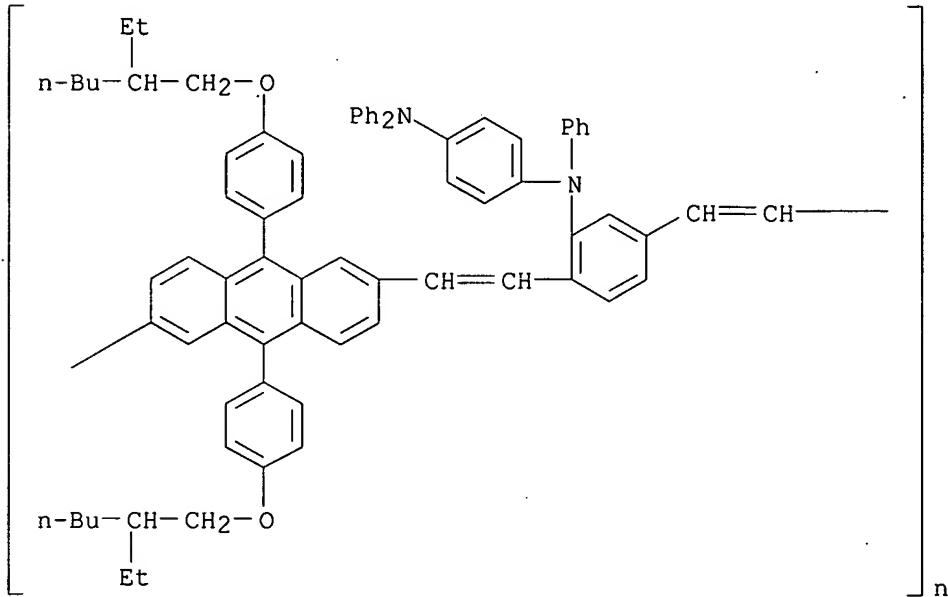

are bonded; and X = a C2-60 conjugated group). The arylamine polymer may be doped with  $\geq 1$  fluorescent dyes, phosphorescent dopants, or other light emitting material. Methods of fabricating the devices are also described which entail forming an organic layer including the arylamine polymers between the anode and the cathode.

AB The authors report the synthesis and characterization of 5 polymers (P1-P5) with arylamine pendants. Various aromatic groups, were incorporated into polymers to fine tune the optoelectronic properties and long side chains were introduced to increase solubility. 9,10-Diphenylanthracene is a highly fluorescent and efficient chromophore and was incorporated into P2. Strong electron withdrawing groups such as CN increase the electron affinity of PPV polymers and facilitate electron injection, so P3 was designed based on this approach. The synthesis of the polymers, their absorption and photoluminescence in solution were reported.

Single-layer ITO/polymer/Mg:Ag devices were fabricated from spin-coated

CC polymer thin films and characterized.

AB The authors report the optical and **electroluminescent** properties of the Li complex of (2,3-dimethyl-8-hydroxyquinoline) Li (LiMMq), exhibiting intense **photoluminescence** (PL), peaked at .apprx.458 nm. As the result of electron-donating Me groups in 8-hydroxyquinoline, the PL spectrum is blue-shifted relative to (8-hydroxyquinoline) Li (Liq). The double-layer **electroluminescent** devices with a novel polymer poly(N,N'-diphenyl-N,N'-bis(4-methylphenyl)-1,4-phenylenediamine-1,3-diisopropenylbenzene) as hole transporting layer and the LiMMq as emitting layer, sandwiched between **cathode** of Mg:Ag alloy and **anode** of In-Sn oxide, were fabricated, and the bright blue **electroluminescence** with luminance of >8000 cd.m<sup>-2</sup> was obtained. The properties indicate that the LiMMq is a potential blue emitting material for the application in light-emitting diodes.

 AB The novel derivs. of tris(8-hydroxyquinoline)aluminum (Alq3), tris[5-(methyl-malononitrile)-8-hydroxyquinoline]aluminum and tris(2,3-dimethyl-8-hydroxyquinoline)aluminum were synthesized. The double-layer **electroluminescent** devices were fabricated with a novel polymer poly(N,N'-diphenyl-N,N'-bis(4-methylphenyl)-1,4-phenylenediamine-1,3-diisopropenylbenzene) as a hole transporting layer and the derivs. as an emitting layer, sandwiched between an **anode** of Mg:Ag and a **cathode** of In-Sn oxide. Bright blue and yellow **electroluminescence** emissions were obtained from the devices. The exptl. results indicate that a functional group of electron acceptors connected to 8-hydroxyquinoline results in the emission red shift and a functional group of electron donors results in the emission blueshift. Alq3 and its derivs. are expected to be used as an emitter to achieve various color emissions.

AB New conjugated light-emitting polymers containing arylamine pendants have been designed, synthesized, and characterized. The resulting polymers are thermally stable, have rigid backbones, show high Tg and Td values, and are readily soluble in organic solvents. The single-layer LED devices fabricated from these polymers emit light ranging from bright yellow to bright red. The color of the emitting light can be tuned by incorporating various aromatic units. The devices show very low turn-on voltages.

AB The authors synthesized a polymer, poly(N,N'-diphenyl-N,N'-bis(4-methylphenyl)-1,4-phenylenediamine-1,3-diisopropenylbenzene) (PDAIPD), of which the energy of the HOMO was measured to be 5.6 eV below vacuum level. PDAIPB was used as a hole transporter in a light emitting diode, with tri(8-hydroxyquinoline)aluminum (Alq<sub>3</sub>) as an electron transporter and emitting layer to ameliorate the stability of the device, and fullerene doped in the hole transporting layer as a sensitizer to study the influence of sensitizer on organic electroluminescence (EL).

Internal EL quantum efficiency as high as 7.8% was obtained under an applied elec. field of 1.2 x 10<sup>6</sup> V/cm and doping fullerene concentration 0.9%.

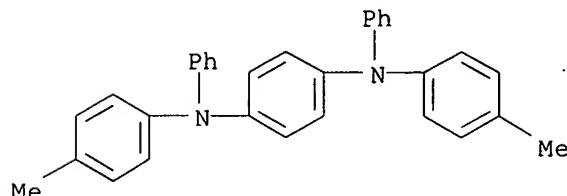

A

function for EL quantum efficiency in terms of the dopant concentration is derived. The theor. anal. is consistent with the exptl. results.

AB New hole transport polymers were prepared by polyaddn. of N,N'-diphenyl-N,N'-bis(4-methylphenyl)-1,4-phenylenediamine with divinyl or diisopropenylbenzene and were characterized by 1H NMR, DSC, UV absorption spectra and cyclic voltammetry. These polymers exhibit high glass transition temps. and low oxidation potentials. Two-layer electroluminescent (EL) devices, in which the polymers were spin cast on ITO anode as the hole transport layer and aluminum tris(8-hydroxyquinoline) (Alq) was used as the emitting layer, gave a high brightness of above 10000 cd m<sup>-2</sup> with an operating voltage of less than 15 V.CC 37-3 (Plastics Manufacture and Processing)

AB Polymers of formula I are provided which are incorporated in organic compns. for use as elec. and electronically active materials used in **semiconductor** devices such as organic light emitting diodes and photorefractive devices, wherein A, B, and C are independently selected from Ph and C1-8 alkyl, C1-8 alkoxy, or C1-8 dialkylamino-substituted Ph, n = 3-10,000. Thus poly(4-vinyltriphenylamine) was prepared by acylation of triphenylamine with acetyl chloride to give 4-acetyltriphenylamine, followed by treating of 4-acetyltriphenylamine with triisopropoxy aluminum to give monomer 4-vinyltriphenylamine, then purifying and free radical polymerization of the monomer, showing number average mol. weight 5460, weight average mol. weight 9940, and

IC polydispersity index 1.82.

AB The styryl-containing polymer is represented by [CH<sub>2</sub>CH(Ar<sub>1</sub>CH:CHAr<sub>2</sub>)]<sub>n</sub> (Ar<sub>1</sub> =

arylene; Ar2 = aryl, condensed polycyclic group, heterocyclic group; Ar1 and Ar2 may be substituted; n = natural number). The above polymer is manufactured by (1) the reaction between a P compound [CH2CH(Ar1CH2X)]n and an aldehyde compound Ar2CHO or (2) the reaction between an aldehyde compound [CH2CH(Ar1CHO)]n and a P compound Ar2CH2X [X = PO(OR1)2 or PR23.Y; R1 = lower alkyl; R2 = cycloalkyl, aryl; Y = halo]. The electroluminescent device contains the polymer in ≥1 organic compound thin layer including a light-emitting layer and the photoreceptor contains the polymer as a charge-transporting material. The hole-transporting material composed of the polymer is also claimed. The styryl-containing polymer shows good performance in charge-transporting and optical conductivity even after repeated use.
